It grows to a height of about 45 cm (18 in), and flowers are red, orange or yellow, sometimes with a faint, but very sweet perfume. It contains small amounts of lycorine, making it poisonous.

Soil: A standard potting mix should be fine.

Water: Suspend water during the winter and resume again in the late winter or early spring.

Fertilizer: During the growing season, fertilize every week with a weak liquid fertilizer. It also works to include controlled-release fertilizer pellets in the soil.

Caring for Clivia Miniata

These plants are relatively heavy feeders and yellow, washed-out leaves and no offsets frequently mean the plant is underfertilized. To prolong flowering, remove older flower stalks by snipping them at the base near the leaves. Also, to keep your plant looking its best, occasionally wipe down or mist the leaves to prevent the collection of dust.
