Description Magnolia liliflora is a small tree native to southwest China, but cultivated for centuries elsewhere in China and also Japan.

**Common name:** Magnolia liliflora Nigra

**Color:** Reddish-purple

**Bloom time:** April to May

**Height:** 8.00 to 12.00 feet

**Difficulty level:** easy to grow

Planting & Care

If you grow tree magnolias from seed they may well take 10-15 years until they first flower. In one instance at Caerhays a magnolia took over 40 years to flower. However, most magnolias sold today are GRAFTED plants. This means that the long wait until first flowering can be readily avoided because of scion material used to make the graft comes from the flowering tips and branches of existing plants.

Some grafted tree magnolias will even flower while still in their pots but it would be very bad luck for a grafted plant not to be flowering away within 3-5 years from planting. This criticism of magnolias is also therefore a misconception.

**Sunlight:** Full Sun to Partial Shade

**Soil:** well-drained soil

**Water:** Medium

**Temperature:** 10 c

**Fertilizer:** Apply any organic fertilizer

**Care:**

- Magnolias perform best in a loamy, well drained soil but rich in organic matter.
- You can make an easy contribution to the organic bit by putting plenty of compost or well rooted manure into the planting pit and keeping the plant regularly mulched.
- Magnolias are surface rooting plants which respond well to mulching.
- 

**Special Feature:**

Specimen or accent. Excellent compact magnolia for sunny areas of the landscape. Excellent accent/specimen or in groups. May be grown as an informal hedge or screen.

Use

**Culinary use:**

- leaves

**Ornamental use:**

- The plant is used for ornamental purpose.

**Note:**

No serious insect or disease problems.
