Description Often forms large colonies in the wild. Will self-seed under optimum growing conditions. As with many of the early spring wildflowers, Mayapple goes dormant in summer.

Common name: may-apple

Color: Green

Bloom time: April

Height: 1.00 to 1.50 feet

Difficulty level: easy to grow

Planting & Care

Mayapples can either be grown from Rhizomes or from seeds. If growing from Rhizomes bury them about 3 cm deep. The seeds should be fresh and sown into flats, under glass, in a shaded part of the garden in august or September.

Seeds can take from one to six months to germinate. Once you see seedlings let them grow for a year; transplant to individual pots and allow the Mayapple to grow for a further year, then transplant into the garden in spring or autumn.

Sunlight: Part shade to full shade

Soil: well-drained soil

Water: Medium

Temprature: 15°C

Fertilizer: Apply any organic fertilizer

Care:

- The ground that Podophyllum plants grow in should be mulched in spring (wood chips) and autumn (leaf mild) to protect the plant.
- As they like a moist soil they should be watered frequently.

- If you require more plants then they can be propagated by division once the plant has finished flowering.

Use

Medicinal use:

- Long history of medicinal use.
- Mayapple, or Podophyllum peltatum, is a flowering perennial plant.
- It s also called American mandrake, wild mandrake, and ground lemon.
-

Culinary use:

- the poisonous leaves and roots in water to make a liquid insecticide for their crops.
- May-apple has culinary uses, too.

Ornamental use:

- Mayapple, Indian apple, Wild mandrake, Pomme de mai, Podophylle pelt.
- Use Ornamental: Sometimes cultivated in woodland gardens.

Note:

please consult appropriate doctor / physian befor use
