Description This membrane is flung off as the flower blooms, revealing the woody fruit containing many eucalyptus tree seeds.

Common name: Eucalyptus

Color: White, pink, yellow, red, orange

Bloom time: late spring to mid-summer.

Height: Eucalyptus tree can reach 33 to 200 feet in height.

Difficulty level: Easy

Planting & Care

Planting in fall or at the start of the rainy season is best. For cold winter areas, plant in the early spring so it has a chance to extend roots before winter sets in. Water the tree well before planting and choose a sunny area. Then, dig a hole larger than the pot you purchased it in and one to two inches deeper. Take the tree out of the pot and separate the roots without breaking very many. Water the tree and fill in the dirt as you water. Cover the new soil with mulch to hold in the water and keep weeds away.

Sunlight: Full Sun

Soil: Well-drained soil.

Water: Water plant once in a week.

Temperature: 80-90 F. (27-32 C).

Fertilizer: Not Required

Harvesting: Each tree can be harvested four to five times during its 20-year life span.

Care:

- Eucalyptus tree care is not difficult, as this type of tree usually maintains itself reasonably well.
- Once established, eucalyptus trees should not require too much watering, with exception for those growing in containers.
- Allow these to dry out somewhat between waterings.
- Additional watering may be necessary during periods of excessive drought, however.
- As for fertilizer, much of the eucalyptus tree information recommends against the use of fertilizer, as they do not appreciate phosphorus.
- Potted eucalyptus may require an occasional slow-release fertilizer (low in phosphorus).
- In addition, eucalyptus tree care includes annual pruning (in summer) to control top growth and their overall height.
- Eucalyptus trees are also known to produce heavy litter in the fall, shedding bark, leaves, and branches.
- As its shred-like bark is considered flammable, keeping this debris cleaned up is preferable.
- If desired, you can collect some seed once it falls, and then plant it in another area of your yard or in a container.

Special Feature:

One of the fastest growing trees in the world, the Eucalyptus, can grow to nearly 50 feet tall in four years.

Use

Medicinal use:

- The dried leaves and oil are used to make medicine.

Culinary use:

- Eucalyptus leaf is LIKELY SAFE when consumed in the small amounts found in foods.

Note:

Eucalyptus oil is LIKELY UNSAFE for children. It should not be taken by mouth or applied to the skin. Not much is known about the safety of using eucalyptus leaves in children. It's best to avoid use in amounts larger than food amounts.
