Description

Description for Albizia procera, Siris

Leaves are made up of leaflets. The bark is smooth. The inflorescence is a large terminal panicle, to 30 cm long, white or greenish-white, sessile, bisexual flowers in small 15-30 flowered heads. The fruit is a flat, papery pod. A. procera was reported to be reproductively mature after approximately three years.

Common name	Flower colours	Bloom time	Height	Difficulty
White siris, Tall albizia, Safed siris, Kinhai	Pale white	June to July	Up to 20 m	Easy to grow

Planting and care

White siris is native to moist deciduous and semi-evergreen hill forests, swamp forests, and lowland savanna woodlands in Asia from northern India through southeast Asia. Direct sowing in the field has proved more successful. Plants can be propagated quite successfully by a stem or root cuttings. In case of line sowing, 2-3 m spacing between lines should be adopted. The seedlings are spaced about 0.5m in the lines.

Sunlight	Soil	Water	Temperature	Fertilizer
Full sun to partial shade	Loams or clays but can tolerate shallow, dry, stony, and sandy soils	Medium	19 to 34 degrees C	Apply any organic fertilizer. The application of phosphorus fertilizer can

improve nodulation and nitrogen fixation.

Caring for *Albizia procera*

- They may become a weed, cut to the ground or burn when you can't control the spreading.
- A 2-inch layer of mulch will help to protect the tree and keep the soil moist.
- If you are getting regular rainfall, it is not necessary to water your tree.
- Plants are susceptible to frost so avoid planting in too much cold.

Harvesting

NA

Typical uses of *Albizia procera*

Special features: Inflorescence

Culinary use: NA
