Description

Description for All Spice

The allspice tree, which is native to the Caribbean and Central America, can be grown successfully in warmer climates in the United States, and once established, is often quite hardy and resistant to minor drought. While female plants need a male pollinator to show fruit, some male plants are able to flower on their own.

Common name	Flower colours	Bloom time	Height	Difficulty
Jamaican pepper, Pimenta or Newspice, myrtle pepper	Brown	April to July	6.00 to 10.00 feet	easy to grow

Planting and care

Plan to grow your Allspice tree in a location where it will receive direct morning light or partially shaded locations in the afternoon. Allspice prefers a well-drained soil, with good moisture holding capacity.

Sunlight	Soil	Water	Temperature	Fertilizer
Full sun to part shade	well-drained soil	Medium	18 and 28 Å° C	Apply any organic fertilizer

Caring for All Spice

- Direct afternoon sunlight in the heat of the day can burn the foliage of a young Allspice tree.

Typical uses of All Spice

Special features: The tree is known to enjoy full sunlight and humidity, and in return, it will supply you with a wealth of shiny evergreen foliage and bring out your inner naturalist, as one of the most sensually aromatic trees in the world.

Culinary use: Allspice is used for pickling, in baking, and its oils are used in a range of products. Leaves from the tree can be used to infuse flavor and aroma in food, particularly those inspired by Caribbean cuisine.

Ornamental use: One of the world's most fragrant trees, even today, its oils are used in perfumes and cosmetics.

Medicinal use: one of the oils found within the allspice fruit, is a natural anesthetic, which can be used in a pinch when your kids are suffering from a toothache or upset stomach.

In Caribbean culture, the leaves and fruit of the allspice tree are often thought to be a natural antioxidant, while it remains notable as a folk remedy to everything from high blood pressure and obesity to menopause.
