

Coleus Coerulescens - Plant

Coleus is a member of the mint family, with its characteristic square stems and oppositely arranged leaves. It's actually a heat-loving herbaceous perennial, but is usually treated as an annual, since even the slightest breath of frost will turn it to mush.

painted nettle, poor man's croton	-	-	1 to 8 feet.	Easy.

Planting and care

Coleus plants should be grown in the garden in bright, indirect light, or in partial shade. The lower growing dwarf varieties (6-12 inch) will create a colourful border, or you can use the taller (up to 36") types as a dramatic background planting.

Many Coleus plants will survive full sun exposure but the foliage colour is often enhanced when they are grown in the shade. Coleus are also quite striking when they are planted in a container and grown as a house plant. By removing the flower spikes as they develop, and keeping the plant pinched back, the Coleus can be kept growing as a perennial for several seasons.

Sunlight	Soil	Water	Temperature	Fertilizer
Dappled or partial shade.	Good quality soil mix.	Evenly moist soil but not soggy. Container plants also require more frequent watering than those grown in the garden.	Average temperature is 90 degrees Fahrenheit.	A balanced, water-soluble fertilizer every two weeks for plants in containers; in the ground, once a month is enough, with the fertilizer diluted to half-strength.

Caring for Coleus Coerulescens

Where the growing season is long, pinch the tips of the stems regularly to encourage branching and compact growth. When growing coleus, keep in mind that these beauties can grow rapidly. Plant coleus close together as bedding plants or tuck them into baskets and containers for a fast growing and spectacular addition. Another factor in coleus care is overwintering, as these plants, which are considered tender annuals, are highly susceptible to cold temperatures.
