Description The cowpea is one of several species of the widely cultivated genus *Vigna*. Four subspecies are recognised, of which three are cultivated: Cowpeas are one of the most important food legume crops in the

Common name: *Vigna unguiculata*

Color: brown

Bloom time: last summer

Height: 80 cm (31.5 in)

Difficulty level: easy to grow

Planting & Care

Start with a fresh garden bed, nicely weeded with the soil loosened and ready for planting. Stick the seeds straight into the dirt, planting about 1 in. deep and 4-6 inches apart, in rows 18 in. Water thoroughly, then wait a few days for the seeds to germinate.

Sunlight: Full Sun

Soil: well-drained soil

Water: medium

Temperature: 65°F

Fertilizer: Apply any organic fertilizer

Care:

- This year I thought it would be fun to try growing "field peas" for the first time.
- Although they're called peas, they're really more like beans, in my opinion.
- I wanted to grow them particularly to experiment with drying and storing them.

Care:

- After a few weeks, the cowpeas will start drying on the vine.
- If you're having a particularly rainy season, you might pick them a little before they turn brown and finish drying indoors so the peas don't mold.
- You also want to pick the pods before they start splitting open.

Special Feature:

Put the dried, even mostly dried, pods in a pillowcase. Toss into clothes dryer on very low for about fifteen minutes. The heat will pull out the rest of the moisture AND split the hulls. Dump into a bucket and shake. Shells and seeds will separate

Use

Medicinal use:

- Philippine Herbal Medicines

Note:

for medicinal use
