Description

Description for Subabul, Leucaena leucocephala

A seed rate of 3 to 4 kg per hectare is recommended. Sowing is preferably done during February-March in a nursery or in polythene bags or in situ at 2 to 3 cm depth. Seedlings (1.5 to 3 months old with 6-8 leaves) are planted in the main field. A spacing of 1 x 0.1 m is recommended for a pure crop of fodder, 1.5 x 0.2 m for planting in boundaries and borders of coconut gardens and 2 x 0.2 m when raised along boundaries.

Common name	Flower colours	Bloom time	Height	Difficulty
Subabul, Leucaena leucocephala	The flowers on the tree grow in spherical bunches and are white in color.	-	5m to 20 m	Easy

Planting and care

The tree grows very well under alkaline soils and also performs under dry clayey soils.

Sunlight	Soil	Water	Temperature	Fertilizer
Full sun	Loamy soil	Normal	20 to 40 degrees C.	-

Caring for Subabul

Typical uses of Subabul

Special features: The tree is highly drought resistant.
