

Dryopteris filixmas - Plant

The semi-evergreen leaves have an upright habit and reach a maximum length of 150 cm (59 in), with a single crown on each rootstock. The bipinnate leaves consist of 20 to 35 pinnae on each side of the rachis. The leaves taper at both ends, with the basal pinnae about half the length of the middle pinnae. The pinules are rather blunt and equally lobed all around. The stalks are covered with orange-brown scales.

Description

Description for Dryopteris filixmas

Dryopteris filix-mas is a common fern of the temperate Northern Hemisphere, native to much of Europe, Asia, and North America. It favours damp shaded areas in the understory of woodlands, but also shady places on hedge-banks, rocks, and screes.

Common name	Flower colours	Bloom time	Height	Difficulty
Male fern	-	Non-flowering	2 to 3 feet	Easy to grow

Planting and care

Propergate by division or rooting plantlets at the tips of runners or from spores. Keep in mind when planting that Common Male Fern is thought of as hardy, so this plant will survive close to or on freezing temperatures.

Sunlight	Soil	Water	Temperature	Fertilizer
Full Sun to Partial Shade	Well-drained soil	Medium	-	Apply any organic fertilizer
