Description

### Description for Durana White Clover

The term white clover is applied to the species in general. *Trifolium repens* is a herbaceous, perennial plant. It is low growing, with heads of whitish flowers, often with a tinge of pink or cream that may come on with the aging of the plant.

The leaves are trifoliolate, smooth, elliptic to egg-shaped and long-petioled. The stems function as stolons, so white clover often forms mats with the stems creeping as much as 18 cm a year, and rooting at the nodes.

Durana is highly persistent under grazing and is best used to enrich existing, unimproved cool or warm season grass pasture, especially if riding a pasture of toxic fescue is not an option. Excellent for grazing fall through early summer. Durana increases the attractiveness and nutritional value of wildlife food plots, alone or in a mixture.

Common name	Flower colours	Bloom time	Height	Difficulty
White clover, Dutch clover, Ladino clover	White	May-October	10 to 30 cm	Easy to grow

### Planting and care

Wet areas along roadsides

Sunlight	Soil	Water	Temperature	Fertilizer
Full sun	Moist, well-drained, clay, loamy	Average	-	Any organic fertilizer

### Caring for Durana White Clover

- For White Clover to prosper, the soil should be well drained, kept moist and grown in full to moderate sun.
- They should be grown in trays or flower boxes that will allow the tips to make contact with the soil to produce the runners.
- If grown indoors, they must be in a sunny location or the stems will stretch and the plant will become leggy with small leaves.

## Typical uses of Durana White Clover
