Description for Ficus Triangularis variegata

Plant height: 5 - 9 inches

Plant spread: 5 - 9 inches

Ficus is a pan-tropical genus of trees, shrubs and vines occupying a wide variety of ecological niches; most are evergreen, but some deciduous species are endemic to areas outside of the tropics and to higher elevations. Fig species are characterized by their unique inflorescence and distinctive pollination syndrome.

The always popular ficus tree is a member of the fig family and perfect for caring for as a houseplant. There are several varieties of this plant that are grown as houseplants.

Ficus plants range from large trees to woody shrubs to trailing vines. The ficus comes in many shapes and sizes that make this a popular focal point in your home.

Ficus, a group of about 900 species of trees, shrubs, and vines, commonly called figs. Native primarily to tropical areas of East Asia, they are distributed throughout the tropics of world. Many are tall forest trees that are buttressed by great spreading roots; others are planted as ornamentals.

The triangular leaf has irregular yellowish-white edges, with shades of green sections in the center.

Common name(s): Triangle ficus, Natal Fig

Flower colours: -

Bloom time: The flowers are inconspicuous.

Max reachable height: 2 meters to 30 meters (98 ft) tall in natural conditions. Most people keep it as indoor for 2 to 3 years.

Difficulty to grow: Easy to medium

Planting and care

Sunlight: Most ficus trees enjoy bright indirect or filtered light with variegated varieties happily able to take medium light. Bright, direct light may result in scalding of the leaves and leaf loss.

Soil: Rich, humusy and well-drained soil

Water: When watering, always check the top of the soil first. If the top of the soil is wet, do not water as this means they have enough moisture. If the top of the soil feels dry to the touch, this indicates that they need water.

Temperature: Ficus trees also cannot tolerate low temperatures or drafts. They need to be kept in temperatures above 60 degrees F (16

degrees C) and actually prefer temperatures above 70 degrees F (21 degrees C).

Fertilizer: Feed with slow-release pellets in the beginning of the growing season. Fertilize once a month in the spring and summer and once every two months in the fall and winter.

Caring for Ficus Triangularis variegata

Cold drafts from windows or doors will harm them, so make sure to place them somewhere where drafts will not be an issue. Losing its leaves is the most common problems with ficus plants. The standard reaction to stress is a leaf drop, whether it is from any of the following: Under watering or over watering, Low humidity, Too little light, Relocation or repotting, Drafts, Range in temperature (too hot or cold). If your ficus is losing its leaves, go through the checklist of proper ficus tree care and correct anything that you find wrong.

Typical uses of Ficus Triangularis variegata

Special features: Most ficus bonsai trees can produce aerial roots in their natural habitat, which are often presented in appealing bonsai creations with many aerial root pillars or root over rock styles. To enable aerial root growth in our homes a humidity of nearly 100% must be achieved artificially.

You can use a glass cover, fish tank or a construction with transparent sheets for this purpose.

The Bodhi tree, under which the Buddha achieved enlightenment, is believed by many to have been a ficus religiosa.

Fig species are characterized by their unique inflorescence and distinctive pollination syndrome, which utilizes wasp species belonging to the Agaonidae family for pollination.

Culinary use: Most people keep it as indoor for 2 to 3 years.

Ornamental use: Ficus trees can maintain their tree-like shape regardless of their size, so this makes them ideal for bonsais or for massive houseplants in large spaces. The plant is used for ornamental purpose. Its generally kep indoor in living room and in terrac area.
