Description

Description for Goldenseal

Goldenseal, also called orangeroot or yellow puccoon, is a perennial herb in the buttercup family Ranunculaceae, native to southeastern Canada and the eastern United States. It may be distinguished by its thick, yellow knotted rootstock.

Common name	Flower colours	Bloom time	Height	Difficulty
Yellow puccoon, orangeroot	Greenish-yellow to greenish-white	April to May	0.75 to 1 feet	Easy to grow

Planting and care

Root division is one of the simplest means of growing new goldenseal plants since it requires very few tools and only a modest investment of time. However, it must only be performed in autumn since the cool, moist weather will help the plants put down new roots without causing undue stress.

Sunlight	Soil	Water	Temperature	Fertilizer
Part shade	Well-drained soil	Medium	35 degrees C to 40 degrees C	Apply any organic fertilizer

Caring for Goldenseal

Place the potted goldenseal rhizome outdoors under dappled sunlight. Water weekly to a 1-inch depth until the autumn rains start. Withhold water during the autumn and winter unless no rain falls for more than than two weeks.

Typical uses of Goldenseal

Special features: Woodland garden, native plant garden, shaded naturalized plantings or wild garden.

Ornamental use: The plant is used for ornamental purpose.

Medicinal use: Goldenseal is used for urinary tract infections (UTIs), internal bleeding, bleeding after childbirth, liver disorders, cancer, chronic fatigue syndrome (CFS), jaundice, gonorrhea, fever, pneumonia, malaria, whooping cough, and an eating disorder called anorexia.
