Description

Description for Jack Fruit, Kathal, Artocarpus Heterophyllus (Grafted)

This otherworldly looking oddity has a very thick, rubbery rind with short blunt spikes and up to 500 seeds. The average fruit is around 35 pounds. All parts of the jack-fruit tree produce opalescent, sticky latex and the tree has a very long tap-root. Growing jack-fruit trees have flowers borne on short branches extending from the trunk and older branches. The jack-fruit (*Artocarpus heterophyllus*) is a common village tree cultivated throughout Malaysia. Fruits are available almost throughout the year though the peaks are around June and December.

Common name	Flower colours	Bloom time	Height	Difficulty
jackfruit,kathal,kathail,	-	-	80 feet.	Easy.

Planting and care

The place chosen for the planting should be first cleared from old tree stumps and old roots to avoid termites and root disease. When necessary, the soil should be ploughed first, then rows are made to mark the planting intervals. Usually, jackfruits are planted at a distance of 30 ft. x 30 ft. In an acre, 48 trees can be planted. In a new area the planting interval can be reduced to 25 ft. x 25 ft., and 69 trees can be planted in an acre.

Sunlight	Soil	Water	Temperature	Fertilizer
Full sun.	Rich, deep and somewhat porous soil.	Keep the soil moist but do not overwater.	Tropical climate.	Fertilize your growing jackfruit tree with nitrogen, phosphorus, potassium, and magnesium applied in a ratio of 8:4:2:1 to 30 grams per tree at six months of age and doubling every six months up to two years of

age. Past the two year mark, growing jackfruit trees should get 1 kg. per tree in the amount of 4:2:4:1 and is applied before and at the end of the wet season.

Caring for Jack Fruit

Other jackfruit care dictates the removal of dead wood and thinning of the growing jackfruit tree. Pruning to keep the jackfruit at about 15 feet high will also facilitate harvesting. Keep the tree roots damp but not wet.

Typical uses of Jack Fruit

Special features:

Culinary use: The pulp of the ripe fruit is eaten fresh or in syrup. They are a valuable source of carbohydrates with a lesser amount of calcium and phosphate.
