Description

Description for Methi Kasturi, Fenugreek

Fenugreek, Latin name *Trigonella foenum-graecum*, is an annual herb native to South Europe and Asia. The plant grows quickly to 2 feet tall and fixes nitrogen into the soil. White or yellow flowers appear in the early summer and develop yellow-brown seed pods in the fall. This legume plant is used for food, seasoning, condiments, medicine, dye and livestock forage.

The plant and seed give off a maple aroma and taste. This herb is tender and does not survive freezing weather, so the seeds are cultivated during the spring after the last frost occurs.

Common name	Flower colours	Bloom time	Height	Difficulty
<i>Trigonella foenum-graecum</i> (botanical name), methi, samudra methi, shanbalile, abesh, hilbeh, hilba, helba, halba	White flowers appear in early summer and develop into long, slender, yellow-brown pods containing the brown seeds of fenugreek.	spring to early autumn seasons.	The plant reaches a height of 0.3 to 0.8 meters and has trifoliolate leaves.	Easy

Planting and care

Choose a suitable place for planting. Choose a position in full sun and with soil that is of good to rich quality and drains well.

The soil should have a pH of around 6.0-7.0 and should remain dry and warm.

Avoid cold, wet soils as these will cause fenugreek seeds to rot. As a legume, fenugreek adds nitrogen to the soil, making it useful as a cover crop restoring nitrogen to the soil.
