Description They appreciate full sun in the spring, but must have semi-shade as the temperatures warm. They are quite tolerant of being transplanted, even when they are in bloom.

Common name: polyanthus

Color: Most colors except green

Bloom time: Seasonal bloomer

Height: 0.50 to 1.00 feet

Difficulty level: easy to grow

Planting & Care

The primrose seeds should be sown on the surface in the autumn. As they are difficult to grow from seed in many areas you may prefer to use plants bought from a garden center; plant these out following the last frost of spring. In both cases small varieties of Primrose should be spaced about 15 to 20 cm apart; and larger Primula varieties about 40 cm apart

Sunlight: Full Sun

Soil: well-drained soil

Water: medium

Temperature: 6-12°F / 3-6°C

Fertilizer: Apply any organic fertilizer

Care:

- When starting off primrose from seed indoors do so about 2 to 3 months in advance (with a view to transplanting them outdoors after the last frost of spring).
- The seeds should be mixed into soil and put in a plastic bag.

Care:

- It is fairly easy to look after primrose, Cowslip and other Primula members.
- They have a preference for a cool soil so it is good to supply a mulch before summer.
- Primula should be fed with a non-organic fertiliser just before flowering.
-

Special Feature:

Primulas are a delightful indoor plant, a true harbinger of spring. They also will grow in the garden, but will not thrive in the heat of summer. Use

Medicinal use:

- ayurvedic

Note:

for medicinal use, please consult appropriate doctor before use.
