Description Stem cuttings can be rooted in water or moist sand and transplanted into pots of fertile potting soil mixture and placed in a sunny location. These plants relish heat, humidity, water, and nutrients. Water spinach does not grow well below 70° F. Some varieties will also thrive in water.

Common name: Water Morning Glory, Swamp cabbage, aquatic morning glory, Chinese water spinach

Color: White, pink, purple

Bloom time: Rarely flowers

Height: 0.50 to 1.00 feet

Difficulty level: easy to grow

Planting & Care

They are usually shipped in the spring as bare roots when plants are fully dormant, well before they have leafed out. They'll look like a bundle of sticks on arrival. Note, they are not dead—simply dormant. If you are buying container-grown plants (vs. bare-root plants), plant them by May or early June for best results.

Sunlight: Full sun

Soil: well-drained soil

Water: Medium to wet

Temperature: 70° F

Fertilizer: Apply any organic fertilizer

Care:

- The deep planting encourages the developing stem to send out roots to help stabilize the plant and perhaps eliminate the need for staking.
- Also, deep planting keeps Bangada bulbs cool when temperatures soar.
- Enrich the soil with leaf mold or well-rotted organic matter to encourage good drainage.
-

Harvesting: 6 weeks

Care:

- To help conserve water, reduce stress, and encourage healthy growth, apply a 2- to 4-inch layer of chopped and shredded leaves, grass clippings, or shredded bark around the base of your plants.
- Allow about an inch of space between the mulch and the base stem of the plant.

Special Feature:

Water spinach is prepared like conventional spinach, although the texture of the stems and leaves is improved if they are cooked separately. It may be steamed, boiled, stir-fried, or used in soups. It may also be eaten in salads, either raw or blanched briefly.

Use

Note:

for medicinal use
