

Phalaenopsis White - Plant

Most are epiphytic shade plants; a few are lithophytes. In the wild, some species grow below the canopies of moist and humid lowland forests, protected against direct sunlight; others grow in seasonally dry or cool environments. The species have adapted individually to these three habitats.

Description

Description for Phalaenopsis White

Phals are easily grown in the home and stay in bloom for a very long time. A mature phal will be in bloom much of the year with graceful inflorescences loaded with good-sized blooms. From pure whites to unusual spotted harlequins, Phalaenopsis are sure to please.

Unlike many other orchids, Phalaenopsis can be repotted anytime, though it is usually best to do so when not in bloom.

Common name	Flower colours	Bloom time	Height	Difficulty
Moth Orchid	White.	Late winter through the spring.	-	Easy.

Planting and care

Sunlight	Soil	Water	Temperature	Fertilizer
Prefer dappled light (an east or west facing windowsill behind a net curtain is ideal).	They should be potted in a more typical houseplant mix that holds some moisture but still drains well.	Do not let the soil dry out.	A minimum temperature of 20 degrees C (68 degrees C).	Give a quarter strength fertiliser once a month.

Caring for Phalaenopsis White

Too much bright light can burn the leaves and turn the plants yellowish while too little will result in plants with soft leaves that don't flower. Repot after flowering. Don't over pot; wash the old compost from the roots before working the new compost gently and firmly around the roots.

Typical uses of Phalaenopsis White

Special features:

Ornamental use: Phals do very well as houseplants and will grow and flower in a moderately bright windowsill.
