Description

Description for Punica Granatum, Pomegranate, Anar

Dwarf pomegranate needs full sun and a well-drained soil mix. Use a soil mix consisting of one part peat moss to one part loam to two parts sand.

Common name	Flower colours	Bloom time	Height	Difficulty
Dwarf pomegranate	Orange-red	Seasonal bloomer	2.00 to 4.00 feet	Easy to grow

Planting and care

The plants thrive in a semi-arid atmosphere and once established need very little water. Fertilize on a monthly basis. Once flowering has begun in mid to late summer, the plant should be watered more frequently to produce lots of flowers. The plants will bear miniature fruit if grown in areas with year-round temperatures that rarely fall below 40Å,Å° F.

Sunlight	Soil	Water	Temperature	Fertilizer
Full sun to part shade	Well drained soil	Medium	30 to 40 degrees C	Apply any organic fertilizer

Caring for Punica Granatum

It generally grows two to four feet high and wide, rarely to six feet high, while with skillful pruning can be restricted to one foot. It is not only small in stature, but even the flowers and fruit are dwarfed. The dwarf pomegranate is a deciduous, thorny shrub. The flowers have an orange-red corolla and the edge of the petals is flesh-colored.

Typical uses of Punica Granatum

Special features: The dwarf pomegranate is a good species to use as a bonsai. It makes an excellent container plant that moves easily from the house to the garden in the cooler climate of St. Louis. In areas a zone or two warmer, this shrubby plant does well in the garden year round.

Ornamental use: The plant is used for ornamental purpose. Some varieties are edible.
