Description

Description for Sedeveria Green Rose

Sedeveria Green Rose is an intergeneric hybrid, made from a cross of Sedum pachyphyllum with Echeveria derenbergii. It has green rosettes that are perfectly symmetrical, looking like green rose flowers. It has yellow, star shaped flowers in summer months.

Common name	Flower colours	Bloom time	Height	Difficulty
Sedeveria Green Rose	Yellow,green	-	upto 1 foot	Easy to grow .

Planting and care

When growing Sedum, keep in mind that Sedum plants need very little attention or care. They will thrive in conditions that many other plants thrive in, but will do just as well in less hospitable areas. They are ideal for that part of your yard that gets too much sun or too little water to grow anything else. A common name for Sedum is Stonecrop, due to the fact that many gardeners joke that only stones need less care and live longer.

Sedum is easily planted. For shorter varieties, simply laying the plant on the ground where you want it to grow is normally enough to get the Sedum plant started there. They will send out roots from wherever the stem is touching the ground and root itself. If you would like to further ensure that the plant will start there, you can add a very thin covering of soil over the plant.

For taller Sedum varieties, you can break off one of the stems and push it into the ground where you would like to grow it. The stem will root very easily and anew plant will be established in a season or two.

For taller Sedum varieties, you can break off one of the stems and push it into the ground where you would like to grow it. The stem will root very easily and anew plant will be established in a season or two.

Typical uses of Sedeveria Green Rose

Special features:

Culinary use: Rose hips are occasionally made into jam, jelly, marmalade, and soup or are brewed for tea, primarily for their high vitamin C content. They are also pressed and filtered to make rose hip syrup.

Rose petals or flower buds are sometimes used to flavour ordinary tea, or combined with other herbs to make herbal teas.

Ornamental use: Roses are best known as ornamental plants grown for their flowers in the garden and sometimes indoors. They have been also used for commercial perfumery and commercial cut flower crops. Some are used as landscape plants, for hedging.

The majority of ornamental roses are hybrids that were bred for their flowers. A few species of roses are grown for attractive or scented foliage

Medicinal use: The rose hip, usually, is used as a minor source of Vitamin C. The fruits of many species have significant levels of vitamins and have been used as a food supplement. Many roses have been used in herbal and folk medicines. Some species have been used for stomach problems, and are being investigated for controlling cancer growth.
