[Ask a question about this product](#)

Description Tolerates poor, dry soils and light shade, but performs best in full sun. May be grown from seed and may self-seed in the garden. This species is primarily clump-forming and does not spread aggressively as do some of the other goldenrod species and hybrids.

Common name: anisescented goldenrod

Color: Yellow

Bloom time: August to September

Height: 2.00 to 4.00 feet

Difficulty level: easy to grow

Planting & Care

The vining varieties require a support structure as some can get 15 feet tall. All plants prefer sun to light shade sites with well-draining and moderately fertile soil. Install the plant in the ground at the same level it was growing in the nursery pot. Most plants are grafted onto the common rootstock because of its superior hardiness.

Sunlight: Full sun to part shade

Soil: well-drained soil

Water: Dry to medium

Temperature: -10 to -14°C

Fertilizer: Apply any organic fertilizer

Care:

- Deadhead religiously and keep beds clean.
- Every leaf has a growth bud, so removing old flower blossoms encourages the plant to make more flowers instead of using the energy to make seeds.
- Clean away from around the base of the rosebushes any trimmed debris that can harbor disease and insects.

Special Feature:

Interesting goldenrod for native plant gardens. Also appropriate for borders, cottage gardens or butterfly gardens. May be grown in herb gardens.

Use

Ornamental use:

- The plant is used for ornamental purpose.

Note:

No serious insect or disease problems. Rust may occur. Watch for powdery mildew and leaf spot.
