Description

Description for Strawberry

They are one of the most productive plants when what is produced from the weight of the plant is considered. The leaves are compound, typically with three leaflets, and usually hairy. The flowers, generally white, rarely reddish, are borne in small clusters on slender stalks. Botanically, the bright colored strawberry fruit is considered an accessory fruit and is not a true berry. Strawberries begin to ripen four to five weeks after the first flowers open and continue to ripen for about three weeks. Propagation is possible by runners.

Common name(s): Strawberry, garden strawberry

Flower colours: White

Bloom time: Late summer and early fall

Max reachable height: Up to 12 inches

Difficulty to grow:: Medium

Planting and care

Strawberries are best planted in the spring or autumn. Sow seeds thinly in March or April in a fine soil-less mix. Simply press the seeds into a moist medium in the starter trays. Keep moist until plants emerge in 2-3 weeks.

Sunlight: Full sun. It can tolerate partial sun for some time.

Soil: Fertile, free-draining soil

Water: Moderate

Temperature: 14 to 26 degrees C

Fertilizer: Organic matter such as compost or well-rotted manure

Caring for Strawberry

- Clear away dead foliage as this can be susceptible to pests and diseases over winter.
- Strawberry plants need to be left outside for the autumn and winter as they require a chill period to initiate flowering.
- Feed your plants with a balanced fertilizer every two weeks until flowering begins, at which point you should switch to a high-potash liquid fertilizer for the best fruiting.
- Nitrogen fertilizer is needed at the beginning of every planting year.

Harvesting

October to November and April to May

Typical uses of Strawberry

Special features: Fruits

Culinary use: Juices, Jams and jellies

Ornamental use: NA

Medicinal use: It contains high anti-oxidant content.
